### Flywheel Grinder Emergency Stop Button Change

Effective immediately the operation of the Emergency Stop button has changed on all Van Norman Flywheel grinders that are equipped with Emergency Stop Button (794-8623-14). This is a change the manufacturer of the button has made, thus the previous style of button is not available as an OEM replacement going forward.

Previously this button operated as a manual depress and manual release button. When pushed, the button would stay depressed until you physically pulled it out. The new replacement button is spring loaded and does not stay depressed. The function is still the same, when pressed the machine fully stops operating until you press a start button.

The way the button is wired does not change and it's effective use also does not change. However, some customers and distributors may be confused or concerned when replacing a button or doing a new install. So if you get any calls about it, just remember, with the new button, it no longer will remain depressed once pressed.
